

EMPHYSEMA is currently described as an abnormal pulmonary system with overinflation and destructive changes of alveolar walls resulting in loss of lung elasticity and decreased gasses. Symptoms include shortness of breath, cough, anxiety, elevated temperature, confusion, weakness, fast heart beat, anorexia and gasping.

Emphysema from our standpoint is simply asthma plus one or more of three fungi.

Histoplasmosis is the most common fungus with a reputation of association with birds. People with this fungus have often reported raising chickens or turkeys or association with a pet bird, but not always. Histoplasmosis is also associated with Addison's Disease, an adrenal disease causing great tiredness.

Chromomycosis is the second most common fungus. It is more associated with an outer skin infection that looks like purplish warts, but is clearly an inside skin infection of the lung tissue.

Blastomycosis, a yeast-like fungus known to invade lungs, kidneys, central nervous system and bones. There is commonly a secondary skin breakout of small papules on the hand, face, neck or other exposed areas where there has been a skin-damaging injury.

It should be noted that there is a combination called Chromoblastomycosis that usually makes a massive skin breakout that oozes, itches and hurts. One person slept in a wet suit because of the continual draining. The remedy by this name eradicated the condition in 4 months.

We have used the asthma protocol with one or more of these fungi quite successfully for this condition. We often use another remedy, Blood Organ Fungus with Breath Free, to clear out generic fungi that accumulate and with these specific fungi. This is used so frequently that even though it is generic, we consider it part of the standard protocol.

By the time a person reaches emphysema, it is reasonable that they will have collected other infections along the way. People are rightfully interested in breathing without difficulty more than healing some known condition. Be sure to go to the sheet of lung complications and other forms of "asthma".

We acknowledge a strange phenomenon with this subject. It seems people who have the condition think there is no cure and therefore have no thought of ever reversing it. They seem to have resigned themselves to a slow death and consequently have no future plans for their lives. As they take the remedies and no longer need oxygen support, they often have "accidents" that take their lives. For reasons we can only suppose this disease carries a fear of getting back in life and frankly, a fear of living. It seems equivalent to having been forcefully retired from a work the person identifies themselves with and there is no thought of identifying with something else. There seems to be a loss of identity in living. We encourage family and friends to help the subjects see a new future. Please help them to reengage in life and make plans for the future.

SUMMARY OF REMEDIES
(w/range of mega bottles)

SYPHILINUM/CHLAMYDINUM/	
TUBERCULINUM	5-6
LUNG WHEEZE	4-6
HERPES #10	2-4
COXSACKIE B3 or	2-4
COXSACKIE B6 or	2-4
COXSACKIE B9	2-4
LYMPHOMA COMPLEX	5-6
HISTOPLASMOSIS	1-4
CHROMOMYCOSIS	1-4
BLASTOMYCOSIS	1-4
BO FNG w/BRE FRE	1-3

EMPHYSEMA

MONTHS OF EXPERIENCE -124
